

introduction

Sustainability is already a key aspect for construction and in particular in construction with concrete. In the future, it will become an even more significant aspect in construction, such as planning, design, execution, maintenance and dismantling. Many research and normative aspects have still to be developed.

The First International Conference on Concrete Sustainability, ICCS13, took place in Tokyo May 2013. Two hundred and forty-five people from 36 countries registered for the conference. It was a success in both scientific output and attendance. The main topics that will be dealt with in the Conference will be environmental impact reduction technologies, sustainability aspects of durability, environmental design, evaluation and systems, socio-economic aspects and case studies on sustainable concrete materials and structures.

Madrid will host the **ICCS Conference in 2016 (ICCS16)**. The venue will be at the Universidad Politécnica de Madrid in its School of Civil Engineers (Escuela de Ingenieros de Caminos, Canales y Puertos).

The conference will be a three-day event that will run from 13-15 June 2016

We invite you to participate through providing a paper or by attending it directly.

For more information, consult www.turismomadrid.es for Madrid and www.iccs16.org for the venue. Should you have questions please contact us at iccs16@caminos.upm.es
